MESSAGE BY THE HON. MINISTER OF HEALTHCARE & NUTRITION

It gives me great pleasure to release this message on the occasion of the release of the 4th edition of the “Essential Medicines List”, by the Ministry of Healthcare & Nutrition.

This concept which was developed in 1976 during the Non Alligned Summit Conference envisions the supply of high quality drugs to all strata of society at an affordable price. This is in line with the current policy of the government of His Excellency, Mahinda Rajapakse and the Ministry of Healthcare & Nutrition has strongly advocated this concept.

I would like to express my gratitude to the expert committee for their recommendations and thank the WHO for the financial assistance provided to make this 4th edition of the “Essential Medicines List” a reality.

I am also grateful to all the ministry officials and the resource personnel from the department of Pharmacology of the Faculty of Medicine, University of Colombo, who contributed towards the successful publication of this booklet.

MESSAGE BY THE SECRETARY/MINISTRY OF HEALTHCARE & NUTRITION

It is with great pleasure that I release this message on the occasion, the Ministry of Healthcare & Nutrition releases the 4th edition of the List of Essential Medicines.

The primary objective of this “Essential Medicines List” is to ensure the availability and affordability of efficacious, safe and good quality drugs while promoting the rational use of medicines by healthcare professionals and also encouraging local manufacturers of essential medicines.

The World Health Organization (WHO) first promoted this concept by publishing a list of essential medicines in 1977. Sri Lanka made its first publication in this regard in 1985. Since then this list has been revised periodically on the advice of several expert committees.

My sincere thanks are due to all the members of the expert committee and I also like to take this opportunity to congratulate Dr. B.V.S.H. Beneragama, Professor Rohini Fernandopulle and Dr. Shalini Sri Ranganathan for the efforts taken to publish this booklet.

MESSAGE FROM THE DIRECTOR GENERAL OF HEALTH SERVICES

The concept of Essential Medicines can be traced back to the Non-Aligned Summit Conference held in Sri Lanka in 1976. The conference adopted a special resolution on drugs, which included the idea that a list of the most Essential Medicines be compiled. The World Health Organization published its first list in 1977.

This is the fourth revision of the Essential Medicines List which was first published in 1985 and it is aimed at supplying safe, effective drugs of acceptable quality to the people of Sri Lanka at affordable prices.

We are grateful to expert committee involved in the compilation of the lists of medicines for the valuable inputs made by members and to the World Health Organization (WHO) for the financial assistance provided for printing this booklet.

I would gladly welcome comments on any shortcomings in this document which could be made use to improve the next revision.

- to ensure the availability and affordability of efficacious, safe and good quality medicines relevant to the healthcare needs of the people in a sustainable and equitable manner;
- to promote the rational use of medicines by healthcare professionals and consumers;
- to promote local manufacture of Essential Medicines

I take this opportunity to thank Dr. U.A. Mendis, Director General of Health Services for his efforts to publish this booklet.

My sincere thanks are due to all members of the expert committee for their contribution and I owe a special word of thanks to Professor Rohini Fernandopulle and Dr. Shalini Sri Ranganathan for taking a lead role to make this report a reality.

INTRODUCTION

The Sri Lanka committee on the selection and use of essential medicines met over three months to revise the Essential Medicines List for the year 2009 based on clinical needs and the burden of disease. It was timed to follow the revision of the World Health Organisation Model List (WHO – ML) by the WHO expert committee in March 2009. In the past the Sri Lanka Essential Medicines List (SL – EML) has been irregularly revised. The committee strongly endorsed the need to revise the list every three years which would follow the revision of WHO –ML which takes place every 2 years .

History of Essential Medicine List in Sri Lanka: Sri Lanka (then Ceylon) created a medicines list for both the state health sector and private sector in 1958. In addition to which, the Ceylon Hospitals Formulary was published by Professor Senaka Bibile to provide information for the use of these medicines. Professor Bibile also set up an international procurement system which decreased costs and at the same time increased the availability of these medicines.

Selection criteria: Essential medicines are selected with due regard to clinical needs and disease prevalence, together with evidence on efficacy and safety, and comparative cost-effectiveness (WHO, 2002)

Purpose: Essential medicines are intended to be available within the context of functioning health systems at all times, in adequate amounts,

in the appropriate dosage forms, with assured quality, and at a price the individual and the country can afford.

Reflecting on the process of developing the 4th revision (2009) of the List of Essential Medicine for Sri Lanka:

The committee tried its best to follow the WHO recommended process in selecting the essential medicines. WHO Model List was used as a template, but it was modified according to the needs of the Sri Lankan population. Needs of Sri Lankan population (patients) were determined using the statistics provided by the Annual Health Bulletin and the recommendations provided by academics and clinicians representing various professional organizations and health care system in Sri Lanka (See List of resource personnel).

It should be acknowledged that the SL – EML has some differences from the WHO Model list. For example having an additional section on “Medicines acting on the ear, nose and oropharynx) and inclusion of medicines removed from the WHO – ML such as theophyllines, and having more medicines than that listed in the WHO – ML.

This was done to make it acceptable to all the health care professionals in our country and after taking into consideration the local experience of experts in the relevant field and resource limitations.

In this revision, for the first time the committee in particular focussed heavily on paediatric medicines to ensure access and availability.

Hospital Formulary List (HFL): This document also contains the Hospital Formulary List which includes the list of medicines requested by the different colleges. The committee selected the “Essential Medicines” for the country from the HFL using the criteria of efficacy, safety and cost effectiveness.

At the conclusion of the meeting the committee noted the following points in relation to the SL – EML.

- The difficulty of making decisions on some medicines because of the lack of local data
- The lack of data on disease burden from the country as a whole as most of available data was from the state sector. Even the data from the state sector was not current as the last published Annual Health Bulletin is for the year 2005.
- Unavailability of some medicines in the required strengths and dosage forms as they were not registered. A List of such medicines was compiled to create “need” awareness among the pharmaceutical industry.
- The need to educate health professionals on the WHO meaning of the term “Essential Medicines”.
- Other than for the Directors, chairperson and secretary the present committee is selected on an ad- hoc basis as representatives of the various Professional Colleges. This is unsatisfactory and it was recommended that an expert committee be appointed by the Director General of Health Services with their terms of reference

defined and conflicts of interest declared to review the SL – EML on an ongoing regular basis in order to recommend deletions and additions after reviewing the scientific evidence.

Explanatory Notes

The **core** list presents a list of minimum medicine needs for a basic healthcare system, listing the most efficacious, safe and cost-effective medicines for priority conditions. Priority conditions are selected on the basis of current and estimated future public health relevance, and potential for safe and cost-effective treatment. The **complementary list** presents essential medicines for priority diseases, for which specialized diagnostic or monitoring facilities, and/or specialist medical care, and/or specialist training are needed. In case of doubt medicines may also be listed as complementary on the basis of consistent higher costs or less attractive cost-effectiveness in a variety of settings.

The listed medicine should be the example for the class for which there is the best evidence for effectiveness and safety. In some cases, this may be the first medicine that is licensed for marketing; in other instances, subsequently licensed compounds may be safer or more effective. Where there is no difference in terms of safety and efficacy data, the listed medicine should be the one that is generally available at the lowest price. The **square box** symbol (□) is primarily intended to indicate similar clinical performance within a pharmacological class.

Dosage form terminology

A. Principle dosage forms used in EML

Oral administration

Tablets

Entries in which the term **tablet** is used without further qualification, are intended to allow/cover the following types of tablet:

- Uncoated or coated (film coated or sugar-coated)
 - Those tablets that are intended to be swallowed whole*
 - Unscrewed
 - Scored*

* Scored tablets may be divided for ease of swallowing, provided dose is a whole number of tablets.

And also to allow/cover, where appropriate:

- Those tablets that are intended to be chewed before being swallowed.
- Those tablets that are intended to be dispersed or dissolved in water or another suitable liquid before being swallowed.
- Those tablets that are intended to be crushed before being swallowed.

The term **tablet** is qualified with an additional term (in parentheses) in entries where one of the following types of tablet is *specifically* intended:

- Chewable – tablets that are intended to be chewed before being swallowed.
- Dispersible - tablets that are intended to be dispersed in water or another suitable liquid before being swallowed.
- Soluble - tablets that are intended to be dissolved in water or another suitable liquid before being swallowed.
- Crushable - tablets that are intended to be crushed before being swallowed.
- Scored – tablets bearing a break mark or marks where sub-division is intended in order to provide doses of less than one tablet.

Note: Crushable, chewable and dispersible tablets may be easier to administer to paediatric populations and to the elderly.

Entries in which the term **tablet** is used without further qualification, are *never* intended to allow any type of modified-release tablet. The term **tablet** is

therefore always qualified with an additional term (in parentheses) in entries where one of the following types of tablet is intended:

- **Gastro-resistant** (such tablets may sometimes be described as enteric-coated or as delayed-release)
- **Prolonged-release**
- Other modified-release form
- **Sublingual**-those tablets that are intended to be placed beneath the tongue

Capsules

Entries in which the term capsule is used without further qualification, are intended to allow hard or soft capsules.

Entries in which the term capsule is used without further qualification, are never intended to allow any type of modified -release capsule the term **capsule** is therefore *always* qualified with an additional term (in parentheses) in entries where one of the following types of capsule is intended:

- **Gastro-resistant** (such capsules may sometimes be described as enteric-coated or as delayed-release)
- **Prolonged-release**
- Other modified-release form

Oral Powder

Entries in which the term **oral powder** is used are intended to allow preparations that are issued to patient as powder (usually as single dose) to be taken in or with water or another suitable liquid.

Oral Liquid

Entries in which the term **oral liquid** is used are intended to allow liquid preparations intended to be *swallowed* i.e.

- Oral solutions, suspensions, emulsions and oral drops
 - Including those continued from powders or granules

But *not* those preparations intended for oromucosal administration e.g. gargles and mouthwashes

Note: Oral liquids presented as powders or granules may offer benefits in the form of better stability and lower transport costs. If more than one type of oral liquid is available on the same market (e.g. solution, suspension, granules for reconstitution), they may be interchanged and in such cases should be bioequivalent. It is preferable that oral liquids do not contain sugar and other solutions for children do not contain alcohol.

Parenteral administration

Injection

Entries in which the term **injection** is used are intended to allow

- Solutions, suspensions and emulsions
 - Including those constituted from powders or concentrated solutions

The term **injection** is qualified by (**oily**) in relevant entries.

In some entries the route of administration is indicated (in parentheses).

Intravenous infusion

Entries in which the term **Intravenous infusion** is used are intended to allow

- Solutions and emulsions
 - Including those constituted from powders or concentrated solutions

B. Other dosage forms

Administration to the eye

The following terms are used:

- Eye drops
- Eye ointments

Topical administration

The following terms are used:

- Cream
- Ointment

For liquids

- Lotions
- Paints

Rectal administration

The following terms are used:

- Suppositories

Vaginal administration

The following terms are used:

- Pessaries or vaginal tablets

For administration by inhalation

The following terms are used:

- Powder for inhalation
- Pressurized inhalation
- Nebuliser solution

EML may wish to allow choice between these three types of preparation for inhalation.

Medicine Strength

The medicines listed in the left-hand column of the EML are usually named as the active moieties, using the International Nonproprietary Name(INN), where applicable.

Entries in the right-hand column of the EML are intended to provide information on the dosage forms and on the strengths (for example, the weight per tablet) of products.

The way that the strengths of dosage forms are expressed in the entries in the right-hand column of the EML reflects the way that the strength of products available in Sri Lanka is declared, that is, how the products are labeled.

In cases where the active Pharmaceutical Ingredient (API)is not the active moiety, the entry in the right-hand column in the EML indicates the form of the API used in the dosage form (by specifying the name of the salt, ester etc in brackets).

- Where the strength of products available is expressed in terms of the active moiety, the name of the salt, ester etc specified in the brackets is preceded by the word "as". An amount given in the right-hand column of the EML is then to be interpreted as an amount of the active moiety listed in the left-hand column.

Example: for ampicillin, the powder for injection strengths of 500mg and 1g (as sodium salt) are to be interpreted as 500mg and 1g of ampicillin.

- Where the strength of products available is expressed in terms of the API, the name of the salt, ester etc specified in brackets is given alone. An amount given in the right-hand column of the EML is then to be interpreted as an amount of the salt ester etc (specified in brackets) of the active moiety listed in the left-hand column.

Example: for codeine, the total strength of 15mg (phosphate) is to be interpreted as 15mg of codeine phosphate.

The **a** symbol indicates that there is an age restriction on the use of the medicine; details for each medicine can be found in Table 1.
